TRIAX MAG FIELD VENUS ENCOUNTER

67-060A-05D

MARINER 5

TRIAX MAG. FLD. VENUS ENCOUNTER

67-060A-05D

This data set has been restored. There was originally one 7-track, 556 BPI tape written in BCD. There is one restored tape written in ASCII. The DR tape is a 3480 cartridge and the DS tape is 9-track, 6250 BPI. The original tape was created on an IBM 7094 computer and the restored tape was created on an IBM 9021 computer. The DR and DS numbers along with the corresponding D number are as follows:

DR#	DS#	D#	FILES	TIME SPAN
-----	-----	-----	-----	-----
DR005473	DS005473	D014476	1	10/19/67 - 10/19/67

MARINER 5

TRIAX MAG FIELD VENUS ENCOUNTER

67-060A-05D

This data set consists of 1, 556 BPI, 7-track BCD tape that was produced on the IBM 7094 computer. The tape contains 357 card images on one file.

<u>D#</u>	<u>C#</u>	<u>TIME SPAN</u>
D-14476	C-11435	10/19/67 - 10/19/67

Table 1.

P1	E -- 156 min	Initial passage through a boundary in the solar plasma
SIA	E -- 22 min	Closest approach to shadow of Venus
IONI	E -- 13.1 min	Initial detection of ionosphere by dual-frequency receiver
DL	E -- 7.9 min	Dark limb of planet observed by ultraviolet photometer
ATMI	E -- 3.18 min	Initial detection of atmosphere by S-band occultation experiment
GO	E -- 2.0 min	"Geometrical occultation"—Earth-spacecraft line of sight intersects dark limb of planet
LOS	E -- 14 sec	Loss of spacecraft radio signal resulting from occultation
E	E	Periaxis
TER	E + 3.4 min	Terminator crossing observed by ultraviolet photometer
QUAD	E + 3.55 min	Quadrature; Sun-Venus-Mariner angle 90°
CO	E + 10.0 min	Center of geometrical occultation
BL	E + 16.7 min	Bright limb crossing observed by ultraviolet photometer
P3	E + 18 min	Final passage through a boundary in the solar plasma
ROS	E + 20.6 min	Reacquisition of signal by Goldstone tracking station
XGO	E + 22.8 min	Exit from geometrical occultation at bright limb
ATMF	E + 23.0 min	Final observation of atmospheric effect on S-band signal
IONF	E + 24.0 min	Final detection of ionosphere by dual-frequency receiver

are overlapping and complementary. However a puzzling inconsistency appears. The minimum altitude quoted for Mariner data (40 km) and the maximum quoted for Venera data (26 km) do not indicate overlap, although the atmospheric data clearly do. Stated in another way, the atmosphere at 26 km from Venera (0.7 atm, 313°K) is observed by Mariner at 6114-km range, corresponding to an altitude of 58 km. It will be of great interest to see how this discrepancy can be reconciled. Until both sets of data have been studied in greater depth, it would be premature to speculate on the cause of the disagreement.

However it should be noted that the two American experiments were made on opposite sides of the planet, with the Russian experiment about halfway between, and that the shape of Venus (which determines the conversion from range to altitude) is completely unknown. The mysteries about Venus have by no means all been dispelled by the two highly successful and complementary Venus missions in October 1967.

The Mariner V spacecraft (Fig. 1) was launched from Cape Kennedy at 06:01:00 U.T. on 14 June 1967. That day had been selected in advance to optimize the value of the scientific data at the planet. An orbit correction maneuver was performed late on 19 June, and the spacecraft passed by Venus on 19 October at 17:34:55.3 U.T., 10,151.0 km from the center. It passed out of telemetry range early in December, and proceeded toward the perihelion of its solar orbit. Like all Mariners, this spacecraft was oriented with respect to Sun and Canopus by an attitude control system to within one-half degree about each axis. An abbreviated chronology of significant

events during the Venus encounter is given in Table 1, which also lists the codes used to represent the events on the orbit plots.

Approximately 850 hours of telemetry data at 33.33 bits per second were received by the Deep Space Net during the first 40 days. Subsequently, at a data rate of 8.33 bits per second, an additional 1670 hours of data were received prior to Venus encounter and about 600 hours were received after encounter. Near the planet 937,000 information bits (of which 648,000 were scientific data) were stored by the spacecraft tape recorder. These were transmitted to Earth twice during the following week.

Of the specifically scientific instruments aboard, four were slightly modified versions of instruments originally built for the 1964 Mars mission—the magnetometer, the plasma probe, the charged-particle detectors, and the ultraviolet photometers. The fifth scientific instrument was the dual frequency radio receiver. The spacecraft science data subsystem provided the sequencing command pulses to operate all these instruments, and transferred their data outputs to the telemetry subsystem. The dual frequency receiver provided scientific data whenever it was receiving signals from the Stanford University transmitter. The other instruments produced data continuously throughout the flight. The spacecraft transponder received commands from Earth and transmitted data to Earth. In addition, it provided the capability for the range data and the Doppler range-rate data required for the celestial mechanics experiment and the radio signal required for the S-band occultation experiment.

The output of the science data sub-

system was in binary digital form, arranged into a frame 420 bits in length, repeated every 50.4 seconds during the latter portion of the flight. During the Venus encounter this "real time data format" was recorded on the magnetic tape and simultaneously sent to the telemetry transmitter. In addition the data from certain experiments (the dual-frequency receiver, the ultraviolet photometers, and one of the charged-particle detectors) were sampled more frequently and recorded on the tape, the data storage rate being 133.33 bits per second.

At the time that Mariner flew by Venus, it was 79,764,370 km from Earth, so that the transit time for radio signals was 266 seconds. To avoid confusion between spacecraft time and Earth time, it is convenient to specify the times of all encounter events relative to the time of closest approach (conventionally called "encounter" and denoted by E).

Figure 2 presents an isometric view of the orbit from E -210 minutes to E +30 minutes, a time period which includes all planet-related observations except that of the outermost edges of the hydrogen corona. The spacecraft approached the dark side of Venus from north of the planet's orbit, crossed the plane of the terminator shortly after passing periaxis, and was deflected sharply (101.5°) in toward Sun by the gravitational field.

The motion of the spacecraft in its actual orbital plane is shown in Fig. 3. This view is the appropriate one for most purposes, as the center of Earth lies only 1.5° off this plane, and the line of sight for the ultraviolet photometers makes an angle of only 3.2° with it. Events pertinent to the ultraviolet experiment and the two occultation experiments are shown on the figure.

A projection onto the plane of the terminator (Fig. 4) depicts the orbit as seen from Sun. This view demonstrates that the spacecraft never passed into the optical shadow of the planet. To have done so would have caused loss of orientation control. The minimum distance to the shadow was more than 2400 km, at E -22 minutes. An additional representation of the orbit, particularly suited to illustrating the plasma interaction, is contained in the following paper (2).

**MARINER 5 VENUS ENCOUNTER DATA**

The accompanying printout and cards contain the following information arranged by columns:

- (1) Frame count (3 digits: 000 to 796);
- (2) Time in decimal hours  $\times 10^3$  measured from closest approach; minus hours are before, plus hours after periapsis; example: -3951 implies 3.951 hours before closest approach.
- (3)  $B_{XASE}$ , the X component of the magnetic field in Aphrodiocentric Solar Ecliptic coordinates; in these coordinates,  $Z_{ASE}$  is parallel to the north ecliptic pole (E) and the prime meridian contains the vector from Venus to the sun (S); Thus,  $X_{ASE} = Y_{ASE} \times Z_{ASE}$ ,  $Y_{ASE} = \frac{E \times S}{|E \times S|}$  and  $Z_{ASE} = E$ ; the units are  $10^{-2}$  gamma; example: -122 implies -1.22 gamma.
- (4)  $B_{YASE}$ , the Y field component in ASE coordinates.
- (5)  $B_{ZASE}$ , the Z field component in ASE coordinates.
- (6)  $B$ , the field magnitude obtained from the square root of the sums of the squares of the components; the three components and the magnitude are averages over one data frame; three vector samples were obtained each frame at unequal intervals of 1/7, 2/7, and 4/7 of the time between frames; at encounter the latter was 50.4 seconds and the corresponding time intervals were 7.2, 14.4, and 28.8 seconds.
- (7)  $S_{XASE}$ , the standard deviation of the X field component ( $B_{XASE}$ ) over the frame whose number is given in column 1; the units are  $10^{-2}$  gamma; example: 30 implies 0.30 gamma.
- (8)  $S_{YASE}$ , the standard deviation of  $B_{YASE}$  over the frame.
- (9)  $S_{ZASE}$ , the standard deviation of  $B_{ZASE}$  over the frame.
- (10)  $S_B$ , the standard deviation of  $B$  over the data frame.

Frame count

Time : 1.17 hours after periastron

$$B_{XASE} = -2.25 \text{ gamma} \quad (\text{average over frame 256})$$

$$B_{YASE} = -5.57 \text{ gamma}$$

$$B_{ZASE} = -4.33 \text{ gamma}$$

$$\text{Field Magnitude, } B = 7.44 \text{ gamma}$$

O

Standard Deviations of  $B_{XASE}$  (over frame 256)

" " "  $B_{YASE}$

" " "  $B_{ZASE}$

" " "  $B$

" " "  $B_{13 \text{ gamma}}$
